Continuation of 3. NOTE: Applicant's arguments filed 1/27/05 have been fully considered but they are not persuasive. Applicant repeats the argument that a person skilled in the art can visually and/or tactically identify drum-formed materials subsequent to the manufacturing process because drum-formed materials have properties distinguishable from other materials. Applicant is urged to provide the distinguishing characteristics in arguments. The process of making the product does not appear to change the end product, thus applicant has the burden of providing evidence establishing an unobvious difference between the claimed product and the prior art product. "The lack of physical description in a product-by-process claim makes determination of the patentability of the claim more difficult, since in spite of the fact that the claim may recite only process limitations, it is the patentability of the product claimed and not of the recited process steps which must be established. We are therefore of the opinion that when the prior art discloses a product which reasonably appears to be either identical with or only slightly different than a product claimed in a product-by-process claim, a rejection based alternatively on either section 102 or section 103 of the statute is eminently fair and acceptable. As a practical matter, the Patent Office is not equipped to manufacture products by the myriad of processes put before it and then obtain prior art products and make physical comparisons therewith." In re Brown, 459 F.2d 531, 535, 173 USPQ 685, 688 (CCPA 1972). MPEP 21113.

Regarding the combination of Everett and Weisman, applicant argues Everett discloses an upper layer having a greater amount of superabsorbent material and a smaller surface area than a lower layer, whereas Weisman discloses just the opposite, namely a lowe layer having a greater amount of superabsorbent material and a smaller surface area than an upper layer. Firstly, Everett does not disclose an upper layer having a greater amount of superabsorbent material as compared to a lower layer. As in the present application, Everett discloses a range of 20-75% superabsorbent. Everett teaches a low saturation level in the upper region (page 14, lines 15-17) and further provides an example of an upper layer with 20% superabsorbent and a lower layer with 40% superabsorbent (Example 2). Thus as the lower layer is intended as the primary retention layer and thus would store more fluids that can potentially cause diaper rash with skin contact. Therefore, the examiner maintains one of ordinary skill in the art would be motivated by the benefits taught in Weisman to modify the second layer to have a surface area smaller than the first layer to minimize skin contact. Additionally, Everett teaches an alternative configuration including a second layer, which has a lateral extent less than a lateral extent of a first primary layer region (page 36, lines 19-2.
